

VP Link™ 3.0

The Dynamic Process Simulation Environment

VP Link *connects* to your offline Control Network to simulate dynamic process responses

VP Link can be used on the staging floor, to facilitate on-going logic debugging and preliminary testing.

Testing

VP Link can be used to systematically test and validate the logic being developed against the customer Test plan.

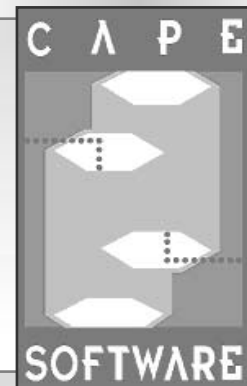

Validation

A VP Link model can be developed before the FAT, in order to provide dynamics feedbacks to the control system. Hence, tests are executed in a more standard, interactive and conclusive fashion.

Training

The model is used for interactive, concurrent operator training. Process upsets is easily generated by the trainer, while responses are tracked for post-analysis
