

VP Link™ 3.0

The Sensible Simulation Environment for Triconex Systems

VP Link *connects* to your offline Safety System and simulates dynamic process responses

Testing

A customized VP Link testing environment is developed before the FAT, in order to facilitate simulated process responses and failure scenarios testing.

A Flexible Client/Server VP Link architecture allows simultaneous testing phases, maximizing testing capability

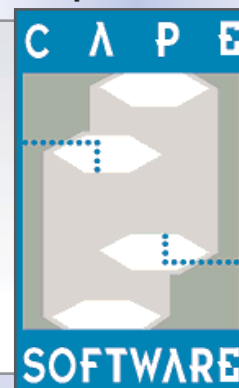

Validation

Automated Test runs can be executed, as a complement to the manual test, resulting in validating documents and periodical testing functionality, in compliance with IEC 61511.

Interfaces

Multiple interfaces are available, such as TSAA, Modbus or VP Link driven real Hardware I/O boards
